Doc Type: Working Group Document<br>Title: Proposal to encode seven additional Myanmar characters in the UCS<br>Source: Ireland (NSAI), United Kingdom (BSI), Myanmar Language Commission, Myanmar Unicode and Natural Language Processing Research Center, Myanmar Computer Federation<br>Status: Member Body contribution<br>Replaces: N2827, N1883R<br>Action: For consideration by JTC1/SC2/WG2 and UTC<br>Date: 2006-03-01

Request. This document asks for a number of disunifications which simplify Myanmar script processing and rendering. The disunifications are necessary for the encoding of minority languages which use the Myanmar script, and solve in addition a number of long-standing problems which have prevented the successful implementation of the Myanmar script for the first official language of the Union of Myanmar. For reasons of urgency of implementation, we ask that the characters requested here be added to the current balloting FPDAM3 of ISO/IEC 10646. The disunifications requested are:

- A new * $\mathrm{U}+102 \mathrm{~B}$ myanmar vowel sign tall aa is disunified from a contextual variant of $\mathrm{U}+102 \mathrm{C}$ MYANMAR VOWEL SIGN AA.
- A new $* \mathrm{U}+103 \mathrm{~A}$ myanmar sign asat is disunified from the existing sequence $\mathrm{U}+1039$ myanmar sign virama U+200C zero width non-Joiner. The glyph for virama is changed.
- A new $* \mathrm{U}+103 \mathrm{~B}$ myanmar consonant sign medial ya is disunified from the existing sequence U+1039 myanmar sign virama U+101A myanmar Letter ya.
- A new *U+103C myanmar consonant sign medial ra is disunified from the existing sequence U+1039 myanmar sign virama U+101B myanmar letter ra.
- A new *U+103D myanmar consonant sign medial wa is disunified from the existing sequence U+1039 myanmar sign virama U+101D myanmar letter wa.
- A new *U+103E myanmar consonant sign medial ha is disunified from the existing sequence U+1039 mYanmar sign virama U+101F myanmar Letter ha.
- A new $* \mathrm{U}+103 \mathrm{~F}$ myanmar letter great sa is disunified from the existing sequence $\mathrm{U}+101 \mathrm{E}$ myanmar letter sa U+1039 myanmar sign virama $\mathrm{U}+101 \mathrm{E}$ myanmar letter sa.
- The glyph for U+104E myanmar symbol aforementioned is changed.
(The asterisk is used to show characters which are not yet encoded.)
If this proposal is adopted, the following characters will exist:

MYANMAR VOWEL SIGN TALL AA

1039

MYANMAR SIGN VIRAMA

- shape shown is arbitrary, not rendered
[glyph change and note change]

| \% | 103A | MYANMAR SIGN ASAT $=$ killer, atha |  |

```

## Rationale for medial disunification

The initial rationale for this request came from a recognition that support for S'gaw Karen requires the disunification of gedial ya from ou ya because S'gaw Karen uses this shape for its MEDIAL LA and an entirely different shape for its $\&$ MEDIAL YA. This disunification allows greater simplicity in the rendering of Myanmar subjoined consonants: $\omega$ YA, ๆ RA, ○ WA and $\omega$ HA which do, in older texts and in minority texts, occur in full subjoined forms. Compare S'gaw Karen $m_{j} k l a$ and $m_{Z} k y a$ with Burmese $\wp_{<} k l a$ and $m_{j}$ $k y a$ and with Mon $m_{\Sigma} k l a$ and $m_{j} k y a$. Note that this is not simply a matter of "spelling". If the model is not changed, and S'gaw Karen were to use $\omega$ YA to represent to be read -la, there is still no letter which could yield \& S'gaw Karen -ya (Mon -la); © LA doesn’t work, because it has a normal subscript form ${ }_{\infty}$ in Burmese and Pali. (A new \& MyANMAR LETTER SGAW KAREN MEDiAL ya will be proposed in a subsequent document dealing with S'gaw Karen, Mon, and other minority languages.)

The current sequences (VIRAMA $+\mathrm{YA} / \mathrm{RA} / \mathrm{WA} / \mathrm{HA}$ ) remain valid sequences but for different renderings. Those renderings do not occur in modern Burmese, but they do occur in older orthography, in Pali and Sanskrit. Encoding the explicit medials allows for simple representation of both kinds of orthography.

```
Sequence
mka+\square virama + w ya
mka+\virama+ףra
m}ka+|virama + o wa
m ka+\square virama+\infty ha
m}ka+gmedial ya
mka+\Gammamedial ra
m}ka+\mathrm{ & medial wa
m ka+, medial ha
```

## Sequence

Current rendering Proposed rendering

Note that kwa with medial wa may take a teardrop or triangular WA shape, which is never the case with true subjoined WA (which is rare, though it occurs in Sanskrit).

## Rationale for ASAT ("killer") disunification

A big advantage of simplifying the use of VIRAMA is that the model becomes similar to the familiar encoding model for Khmer and Kharoshthi. The killer \& ASAT, which occurs with very high frequency in all of the languages of Myanmar, may now simply be rendered as a combining diacritical mark. The ongoing difficulties of implementation involving ZERO WIDTH NON-JOINER are now moot. Thus processes which remove ZWJ and ZWNJ now can handle Myanmar script without problem. (See Figure 3.)

## Rationale for tall aA disunification

Since S'gaw Karen only has one form of the the AA vowel, namely , the previous contextual variation of the AA between short and tall form is no longer universally applicable for the Myanmar script. Disunification of these two forms is therefore necessary and the introduction of vowel sign tall aa has been proposed. Speakers of Burmese are taught to make the size distinction when they learn to write, and keyboards contain two separate keys for the short and tall forms, so no disadvantage will be had by Burmese-speaking users, who already make a distinction in practice if not in the current UCS encoding. It is important to note that in sorting and searching, tall AA and AA should be considered equivalent. Compare S'gaw Karen $m$ 线 $k \bar{a}$ and of $w \bar{a}$ with Burmese $m>\bar{a}$ and ol $w \bar{a}$. In sorting, both $m$ and mold be equivalent at the first level, with $m>$ preceding $m$ to break ties.

## Rationale for Great sa disunification

A consequence of the simplified encoding model is that SA VIRAMA SA will stack: O. The special conjunct $^{2}$ form called GREAT SA is best rendered with the use of a single character 0 , because GREAT SA is not just a ligature of two SAs: consider Pali $\omega 00$ sassa 'corn, crop'; this could also be written (though by convention it is not; in modern Burmese 00 occurs within words while 500 occurs on word boundaries). Note that in sorting and searching, GREAT SA and SA VIRAMA SA should be considered equivalent; in sorting, they are equivalent at the first level, with 00 preceding $\supseteq_{3}$ to break ties.

## Advantages for representation of kinzi

Another advantage of the simplifications to the encoding model is the rationalisation of the approach to encoding kinzi, which can now be considered a simple unambiguous sequence: NGA + ASAT + VIRAMA. This is simply a rendering rule, where the NGA and the ASAT are drawn in reduced size and where the subjoined character retains its full size and position relative to the baseline. Thus NG + ASAT + VIRAMA +

 same model: §ós nirvana (Pali ఫ̊ర̧ nibbana) is encoded NA + I + RA + ASAT + VIRAMA + WA + NA; when repha is not preferred, ASAT is deleted for $\uparrow$ §§§ NA $+\mathrm{I}+\mathrm{RA}+$ VIRAMA $+\mathrm{WA}+\mathrm{NA}$.
An example of the problems with the previous model can be found with the word niran: 'to refuse'. The current UCS encoding model requires this to be represented NGA + VIRAMA + RA $\operatorname{INGA}+$ VIRAMA + ZWNJ +
 allow the user to choose either form (even the incorrect one) simply and predictably: NGA + MEDIAL-RA I NGA + ASAT + VISARGA, and NGA + ASAT + VIRAMA + RA $I N G A+$ ASAT + VISARGA.

## Rationale for change of glyph for SYMbOL AFOREMENTIONED

 following $\varepsilon_{0}$ in the code charts: $q_{c_{0}}$. But the abbreviation can also be written with kinzi: $\xi_{q}$. The first of
these should be represented explicitly with SYMBOL AFOREMENTIONED + NGA + ASAT + VISARGA, the second, kinzi form, should be represented as NGA + ASAT + VIRAMA + SYMBOL AFOREMENTIONED.

## Impact on current implementations

All of the implementors who took part in the workshop-including local implementors in Myanmar as well as foreign implementors, including members of SIL-are in unanimous agreement that the changes requested in this proposal meet their requirements, solve their problems, and are the way forward. Impact on existing implementations of Unicode 4.1 text can be considered effectively nil. All implementations within Myanmar are still experimental and we are aware of only one complete Unicode 4.1 compliant implementation outside of Myanmar-and that implementor (Martin Hosken of SIL) has stated that he would be only too happy to change his software to support these changes and make any transcoding changes required.

## Rationale for fast-tracking request

It is worth revisiting the previous WG2 decision in N1883R (1998-09-24):
> "The Myanmar delegation agreed after some discussion that $[K A+$ VIRAMA + YA $\rightarrow$ mj kya] was a possible and consistent representation, and that it would avoid the problem of possible alternative representations of the same text (the problem which would arise if other subjoined consonants were to be encoded when using the virama model). They agreed to engage in testing of Myanmar text representation with virama and without a separate encoding for glide consonants. In the meantime, they agreed that 10646 need not include the glide consonant forms, as long as sufficient structural gaps were left so that if implementation experience proves that they must be encoded, they could be added later without significant disruption of the core ordering of the chart. This requirement is met by the proposed disposition of comments, and this position was unanimously assented to by the Ad Hoc Committee."

Since 1998 it has been shown that the model without the medials does not work adequately. While all current implementations are at research level, some are ready for production and delaying a change could result in considerable text to transcode. Participants in the Workshop on Myanmar Language Processing (Yangon, 13-15 February 2006) are unanimous in their desire to move forward in implementation with the new characters and code positions as listed in this proposal as soon as possible.

## Acknowledgements

This project was made possible in part by a grant from the U.S. National Endowment for the Humanities, which funded the Universal Scripts Project (part of the Script Encoding Initiative at UC Berkeley).

Figure 4. myanmar symbol aforementioned shown with two spellings, qcis and $q_{q}^{\varepsilon}$.

Figure 5. A draft pre-Unicode 1.0 chart for the Myanmar script, showing the base glyph for *0F73 symbol aforementioned, and encoding *0F77 great sa, *0F78 medial ya, *0F79 medial ra, *0F7A medial wa, and *0F7C medial ha. This pre-Unicode 1.0 proposal used contextual rendering for aA and LONG AA ( $* 0 \mathrm{~F} 3 \mathrm{E}$ ), and did not distinguish between virama and ASAT ( $* 0 \mathrm{~F} 4 \mathrm{D}$ ).
Kinzi was represented by a combining character in this pre-Unicode 1.0 proposal, which would have been less advantageous than the representation given in the present proposal. (The identification of the document isn't entirely certain. Burmese is given from *0F00-0F7F, followed by Khmer from 0F80. After the Burmese table is a list of names, at the end of which is the note:
"Burmese letter names (very approximate etymological transliterations \& notes by Lloyd Anderson)".)
We present this table here only to show that the encoding model we propose is not new. N1883R shows that there was clear consensus from representatives of the Ireland, Myanmar, the UK, and the US to adopt the current model. Although that model has proved inadequate, we are confident that the present proposal will solve the problems and enable Myanmar script processing with UCS encoding.

## A. Administrative

1. Title

Proposal for encoding seven additional Myanmar characters in the UCS
2. Requester's name

Ireland (NSAI), United Kingdom (BSI), Myanmar Language Commission, Myanmar Unicode and Natural Language Processing Research Center, Myanmar Computer Federation
3. Requester type (Member body/Liaison/Individual contribution)

Member body contribution.
4. Submission date

2006-03-01
5. Requester's reference (if applicable)
6. Choose one of the following:

6a. This is a complete proposal
Yes.
6b. More information will be provided later
No.

## B. Technical - General

1. Choose one of the following:

1a. This proposal is for a new script (set of characters)
No.
Proposed name of script
1b. The proposal is for addition of character(s) to an existing block
Yes.
1c. Name of the existing block
Myanmar.
2. Number of characters in proposal

7
3. Proposed category (see section II, Character Categories)

Category A.
4a. Proposed Level of Implementation (1, 2 or 3) (see clause 14, ISO/IEC 10646-1: 2000)
Level 2
4b. Is a rationale provided for the choice?
Yes.
4c. If YES, reference
Brahmic Level 2 implementation.
5a. Is a repertoire including character names provided?
Yes.
5b. If YES, are the names in accordance with the character naming guidelines in Annex L of ISO/IEC 10646-1: 2000?
Yes.
5c. Are the character shapes attached in a legible form suitable for review?
Yes.
6a. Who will provide the appropriate computerized font (ordered preference: True Type, or PostScript format) for publishing the standard?
Michael Everson.
6b. If available now, identify source(s) for the font (include address, e-mail, ftp-site, etc.) and indicate the tools used:
Michael Everson, Fontographer.
7a. Are references (to other character sets, dictionaries, descriptive texts etc.) provided?
No.
7b. Are published examples of use (such as samples from newspapers, magazines, or other sources) of proposed characters attached?
No. The characters to be represented are not new to SC2.
8. Does the proposal address other aspects of character data processing (if applicable) such as input, presentation, sorting, searching, indexing, transliteration etc. (if yes please enclose information)?
Yes.
9. Submitters are invited to provide any additional information about Properties of the proposed Character(s) or Script that will assist in correct understanding of and correct linguistic processing of the proposed character(s) or script.
See above.

## C. Technical - Justification

1. Has this proposal for addition of character(s) been submitted before? If YES, explain.

Yes. See N2827, N1883R.
2a. Has contact been made to members of the user community (for example: National Body, user groups of the script or characters, other experts, etc.)?
Yes.

2b. If YES, with whom?
San Lwin (Director General, Myanmar Language Commission), Tun Tint (Myanmar Language Commission), Thein Oo (President, Myanmar Computer Federation), Kyaw Thein (Vice-President, Myanmar Computer Federation), Myint Myint Than (Director, Myanmar Computer Federation), Zaw Htut (Myanmar Computer Professional Association, Myanmar's NET), Htoo Myint Naung (MyMyanmar Project, Technomation Studios, Universities of Computer Studies Yangon), Myint Thu (MyMyanmar Project, Myanmar Heritage Publications), Ngwe Tun (Mon-Myanmar Computer Professional Association, Solveware Solution, Myanmar Info-Tech), Maung Maung Thant (Myanmar Computer Professional Association), Jai Pah Bung Mein (Shan-SSi Technologies), Saw Hare Sei (S'gaw KarenAyeyawady Data Centre), Saw Baldwin Khaing Oo (S'gaw Karen - Ayeyawady Data Centre), Nant Silver Tun (Western Pwo KarenPwo Kayin Conference), William Wai Lin Kyaw (Myanmar Computer Professional Association, Myanmar Linux Users Group), Ye Myat Thu (Alpha Mandalay, Alpha Info-Tech), Martin Hosken (Payap University), Keith Stribley (Thanlwinsoft), John Okell (SOAS), Justin Watkins (SOAS).
2c. If YES, available relevant documents
3. Information on the user community for the proposed characters (for example: size, demographics, information technology use, or publishing use) is included?
People in Myanmar.
4a. The context of use for the proposed characters (type of use; common or rare)
Common.
4b. Reference
5a. Are the proposed characters in current use by the user community?
Yes.
5b. If YES, where?
In Myanmar.
6a. After giving due considerations to the principles in Principles and Procedures document (a WG 2 standing document) must the proposed characters be entirely in the BMP?
Yes.
6b. If YES, is a rationale provided?
Yes.
6c. If YES, reference
Contemporary use and accordance with the Roadmap.
7. Should the proposed characters be kept together in a contiguous range (rather than being scattered)?

N/A.
8a. Can any of the proposed characters be considered a presentation form of an existing character or character sequence?
Yes.
$\mathbf{8 b}$. If YES, is a rationale for its inclusion provided?
This proposal requests disunifications and a change in the sequences currently specified for Myanmar because those sequences do not work.
8c. If YES, reference
9a. Can any of the proposed characters be encoded using a composed character sequence of either existing characters or other proposed characters?
No.
9b. If YES, is a rationale for its inclusion provided?
9c. If YES, reference
10a. Can any of the proposed character(s) be considered to be similar (in appearance or function) to an existing character?
No.
10b. If YES, is a rationale for its inclusion provided?
10c. If YES, reference
11a. Does the proposal include use of combining characters and/or use of composite sequences (see clauses 4.12 and 4.14 in ISO/IEC
10646-1: 2000)?
Yes.
11b. If YES, is a rationale for such use provided?
Yes.
11c. If YES, reference
Brahmic vowel and consonant signs.
12a. Is a list of composite sequences and their corresponding glyph images (graphic symbols) provided?
No.
12b. If YES, reference
13a. Does the proposal contain characters with any special properties such as control function or similar semantics?
No.
13b. If YES, describe in detail (include attachment if necessary)
14a. Does the proposal contain any Ideographic compatibility character(s)?
No.
14b. If YES, is the equivalent corresponding unified ideographic character(s) identified?
